### PROJECT NAME:SMART SOLUTIONS FOR RAILWAYS

#### Develop a Python script

Create a code snippet using python to

1. Extract weather data from Open Weather Map using APIs
2. Send the extracted data to the cloud
3. Receive data from the cloud and view it in the python compiler

The image shows a screenshot of a Python script and its output. The script is named `weatherMap.py` and is located at `E:/IBM/pre/weatherMap.py`. The script uses the `requests` library to fetch weather data from the Open Weather Map API for Chennai, India. The output shows the temperature and humidity.

```
import requests
a = "https://api.openweathermap.org/data/2.5/weather?q=Chennai,IN&appid=6d13d12f9cd34a07871a5795d01e2c47"
r = requests.get(url = a)
data = r.json()
print(r)
print(data)
temp = data["main"]["temp"]
hum = data["main"]["humidity"]
print("Temperature is : ",temp)
print("Humidity is : ",hum)
```

The output of the script is as follows:

```
<Response [200]>
Temperature is : 298.14
>>>
===== RESTART: E:/IBM/pre/weatherMap.py =====
